## How to remove a pegasus shower faucet cartridge

Locate the cover on the handle of the Pegasus faucet and take it off by prying it up with your fingers. Set the part aside. If the part does not com up easily, use the edge of a knife to pry it up. Unscrew the retaining screw, located on the top of the handle right in the center, with a Phillips screwdriver. Are Glacier Bay and Pegasus the same? However, one of Home Depot's other proprietary faucet brands — Glacier Bay — typically uses the same parts as Pegasus. Why do I need to replace my Pegasus faucet? The part you typically need to replace to repair Pegasus faucets is the cartridge, but sometimes the aerator or check valve gets clogged too. Most faucet leaks, drips and "stuck" handles stem from a worn-out cartridge. Where is the cartridge on a Pegasus faucet? The cartridge lies directly underneath the tap handle. If your Pegasus faucet has separate hot and cold taps, then there's a cartridge under each one. To access the cartridge, you'll need to remove the handle. Start by turning off both the hot and cold water supply valves under the sink. Where can I buy a new fill valve? A new fill valve assembly can be purchased at hardware or plumbing supply stores. The package should include the Fill valve assembly, refill tube, lock nut and any gaskets. The tools needed to replace the Fill Valve are a pair of rib joint pliers, an adjustable open-end wrench, and a small plastic bin. Where can I find parts for my Pegasus faucet? Your best bet to find parts is calling the warranty number that came with your faucet. Pegasus faucets come with a limited lifetime warranty that will provide you with free parts as long as you own the faucet. Remove the handle assemblies. Pop out the screw caps on the top of each handle with your fingers. Is there a warranty on a Pegasus faucet? Pegasus faucets come with a limited lifetime warranty that will provide you with free parts as long as you own the faucet. What to do if your Pegasus faucet has a dip in pressure? If your Pegasus faucet seems to have experienced a dip in water pressure, first verify that the water supply valves are open all the way and that there are no kinks in the supply lines. Then, remove the aerator from the end of the spout. Why does my Pegasus faucet keep leaking water? The act of holding back water pressure and coming into contact with the abrasive minerals naturally found in "hard" water will eventually cause the faucet's inner workings to wear down, causing drips or leaks. However, you often don't have to go to the trouble of completely replacing the faucet if you like its design. How do you remove faucet handles that have no screws? How do I know what shower cartridge I have? Are shower cartridges universal? How do you change a Gerber shower cartridge? Hi, My shower has had a slow week for a number of days and i am having pegasus send me a new cartridge which i believe is the problem. The problem i am having is that i have removed all the parts i think that need to be removed but cannot get the cartridge out. I have included a picture of the cartridge. Any help would be very appreciated. Thanks It looks like it should just pull out, but we do not know what you have removed so far, so we do not know if something you removed held it in, or if the retainer is still there "somewhere". This is a sponsored advertisement. I removed the sleeve surrounding the cartridge as well as a red cap piece that was fitted around the white piece of the cartridge. I don't see any retainer pin to pull out. so i'm kind of stumped. here is another picture if it helps at all That "multisided" brass piece is the retainer. Unscrew it, then grab the white stem and pull HARD to remove the cartridge. ahhh ok. thanks. will try and report back. i had unscrewed only the top piece of the retainer then i guess. would make sense the rest of it would unscrew out of there. i did get some more info with updated pictures as to what i have already taken off. The shower unit is a Glacier Bay Lyndhurst 1-Handle Tub and Shower Faucet in Brushed Nickel so i was not able as of yet to remove the cartridge. I guess my question would be. Does the piece that has threads screw out of there? or does the whole assembly screw out from all the back where it meets the pipes? I would try a strap wrench on the nickel sleeve surrounding the cartridge. They're two different materials(sleeve and brass rough in) and have to separate somehow. That "threaded thing" has "flats" on the sides so you can use a wrench to unscrew it. Just unscrew it and pull the cartridge out, as you were told previously. I got the threaded piece off last night, was just on their tightly and i was afraid of doing something wrong. i used a wrench on the flat side of the threaded piece and it came right off. thanks for the help If you cringe at the high rates for plumbers, take comfort in knowing that replacing an outdated or leaky faucet is easier than you think. Whether you have leaking faucet O-rings or want to update your 1980's faux crystal knob, this tutorial will have you going with the flow in no time. Armed with a few simple tools and tips for how to install a bathroom faucet, you can complete this project in about an hour. Buy a Faucet Before buying a new faucet, take a look at the existing one. You want to make sure the new faucet fits your sink. For example, your sink could have one, two or three holes to fit the faucet. Another thing to look for is whether the holes are widespread or centerset. If necessary, take the old faucet with you and ask for assistance. Remove the Old Faucet Turn off the water supply using the valves under the sink (in most cases). If you aren't sure how to turn off the water to that particular faucet, you can turn off water to the house at the main valve outside. Next, turn on the faucet to drain any water left in the lines. Disconnect the supply lines from the faucet. If the connection can't be reached by hand use a basin wrench. Next, disconnect the lift rod and remove the nuts from under the faucet. Lift the faucet out from the top. Remove the Drain Unscrew the slip nut on the P-trap and put a bucket under it to catch any water in the trap. Disconnect the drain flange from the tailpiece. There should be a piece that can be unscrewed. When the drain has been removed, clean around the old drain and faucet holes. If any sticky silicone sealant remains, remove it using a small amount of mineral spirits. Install the New Faucet Follow the manufacturer's directions for this step, as each faucet will have its own set of specific installation instructions. Most instructions start with installing the gasket on the bottom of the faucet. Some models may require plumber's putty or sealant. Next, put the new faucet through the mounting holes located in the sink and then tighten the mounting nuts. Attach the Handles Not all faucets are preassembled, so you may have to attach the handles. To do so, just slip the guide ring onto the bottom of the handle and position it on the faucet base. Then secure it with the setscrew, the tiny screw on the underside of the handle. Your new faucet most likely came with a hex wrench for tightening it. Position the Drain Body Next, move on to the drain. Take the drain body and screw the nut all the way down on it, and then push the gasket over it. Some types of gaskets are threaded and simply screw into place. Apply a small amount of silicone or plumber's putty under the flange. Making sure the pivot hole is facing the back, position the drain body on the bottom of the sink and screw the flange on from the top side. Install the Drain Rod Under the sink, tighten the nut and gasket. If there is any excess silicone on the top, use mineral spirits for cleaning up. The drain rod is installed next. Begin by unscrewing the pivot nut on the drain body and then insert the horizontal rod through the hole in the stopper. Replace the nut next and then push the horizontal rod down and secure the lift rod to the strap with the screw. Test the lift rod to make sure it's working properly. Connect the Water Supply Now it's time to reconnect the supply lines to the faucet and turn the water back on at the valve. If the sink is already in place, you can use a basin wrench to reach the faucet shanks. Flush the faucet by removing the aerator. Some faucets include a tool to unscrew the aerator. Flushing the faucet gets rid of sediment or debris in the faucet. Turn on the faucet and let the hot and cold water run for about a minute. Check all the connections to make sure there are no leaks. Retighten as needed and screw the aerator back on. MORE FROM QUESTIONSANSWERED.NET
